## Best Practice 2: Extended CBCT for smooth understanding hard and soft tissue

Our institute has integrated the use of advanced imaging technology, such as Extended Cone Beam Computed Tomography (CBCT), to provide a more detailed and precise evaluation of both hard and soft tissues in dental diagnostics. CBCT offers three-dimensional imaging, which allows for a thorough assessment of bone structures, tooth alignment, and other hard tissue features, as well as soft tissues such as the gums, muscles, and nerves. This advanced imaging technique ensures that our dental professionals have a comprehensive understanding of a patient's condition, facilitating more accurate diagnoses and treatment planning. By utilizing CBCT, we can enhance the effectiveness of our interventions, leading to improved outcomes for patients. Our postgraduates of all department undergo extensive training during the initial details of joining the course. As the understanding of radio diagnosis is very crucial this program helps the students to understand and correlate with clinical findings for providing the appropriate diagnosis and treatment.

## **Best Practice 1: Serving the under served community**

To support oral health awareness and education, we have organized various outreach activities in collaboration with local authorities, including dental health camps in schools throughout Davangere and surrounding areas. Total of 123 camps have focused on educating students and the general public about the importance of oral hygiene and its maintenance.

Our institute is committed to extending its services to all sections of society. In some areas of the district, access to basic health services, including dental care, is limited. This lack of awareness, combined with the remoteness of these areas, has led to widespread dental complications. To address this issue, we have adopted several villages and have been providing regular dental health care services for over two decades. Specifically, we have collaborated with primary health centers (PHCs) in villages like Hadadi and Bada, where a total of 6050 patients were screened and offered routine dental check-ups and basic treatments. This initiative has helped ensure that these communities receive the dental care they need in a timely and consistent manner.
